

Scout App v10.13 Full User Guide

Simple guide for using Scout to find leads, find emails, send messages, track replies, and follow up. Written with no developer words.

Main rule: Scout does the work while you are on the app. If you want Scout to send now, keep the app open until the run finishes.

Quick Start

Use this short flow when you only want to get work done quickly.

Step	What to do
1	Go to Settings and connect your Gmail accounts.
2	Add your signature and logo. Send a test email to yourself.
3	Add your templates: first message, follow-up, and reply templates.
4	Upload leads or collect leads with the extension.
5	Go to Find Leads and run Auto Scout for leads with no email.
6	Go to Send Emails, choose who to contact, choose a template, choose sender accounts, and click Send Now.
7	Check Replies later. Open a reply and answer from Scout.
8	After 72 hours, open Due Follow-ups, choose a follow-up template, and send now.

Home / Dashboard

Home is the control center. It should show what matters today and help you choose the next action.

Element	Meaning and example
Analysis cards	Shows important numbers first. Example: ready to email, replies, due follow-ups, emails found, and sending today. Use this to decide what to do next.
Dashboard checklist	A 12-step setup and work checklist. A task becomes checked when Scout sees that you completed it. Example: after you connect Gmail, that item becomes complete.
Find missing emails button	Takes you to Auto Scout so Scout can look for emails on websites. Use this when many leads have no email.
Send emails button	Takes you to the sending page. Use this when you already have contactable leads.
Send due follow-ups button	Takes you to people who got a first message at least 72 hours ago and did not send a real reply.
Try challenges button	Takes you to outreach challenges and progress goals.
Scouting Level	Small level widget at the lower-left. Click it to see your current stage and hints. It does not show exact requirements.
Notification bell	Shows important app alerts like sender paused, reply found, schedule due, or Auto Scout complete.

Live Work	Small bubble that shows what Scout is doing right now. It should show current work, not old history.
-----------	--

Example: If Home says 5,000 leads need emails, your next best action is Find missing emails. If Home says 300 due follow-ups, your next best action is Send due follow-ups.

Dashboard Checklist

The checklist keeps the app easy. It shows the normal path from setup to real outreach.

Task	What it means
1. Connect Gmail accounts	Add Gmail senders so Scout can send messages.
2. Add signature and logo	Add your name, business info, and logo so emails look professional.
3. Add first-message templates	Create messages used only for first outreach.
4. Add follow-up templates	Create messages used only after 72 hours with no real reply.
5. Add reply templates	Create short messages to answer prospects from Scout.
6. Import leads	Upload a list or bring leads in from the extension.
7. Auto Scout missing emails	Use Auto Scout to look for emails for no-email leads.
8. Get trusted emails	Have usable emails that Scout trusts enough to send.
9. Send first message	Send a first outreach message.
10. Check replies	Sync replies and separate real replies from automatic messages.
11. Respond to a prospect from Scout	Open a real reply and answer using the same Gmail account that originally sent the message.
12. Send due follow-ups	Send follow-ups to people who did not send a real reply after 72 hours.

Find Leads Page

Find Leads should be the place for bringing leads in and preparing them for sending.

Element	What it does
Upload leads	Upload a CSV spreadsheet. Scout reads business names, websites, email fields, country/location fields, and raw fields when needed.
Auto Scout	Finds missing emails by checking business websites and useful pages like contact, about, team, help, and footer pages.
Verify emails	Lets you review emails, remove bad emails, and ask Scout to detect again.
Leads list	Shows all businesses and lets you open one business to see details and conversation history.
Bad inboxes	Shows emails that bounced, failed, were blocked, or should not be contacted again.
Country-only filters	Shows country names only, not exact addresses. Scout scans location, country, city, region, market, address, and raw upload data, then extracts a country for safer filtering.

Auto Scout Page

Auto Scout finds missing emails. In v10.13 it has one main setting only: how many leads to queue. The other speed settings are automatic because they can confuse users and can make the page too heavy on mobile.

Element	What it does
Need emails	How many leads still need an email. Example: 5,138 means Scout has many leads to research.
Waiting	How many email-finding jobs are queued and waiting.
Checking now	How many website checks are currently running.
Emails found	How many leads now have emails.
How many leads should Scout queue?	The only Auto Scout setting you choose. Example: enter 500 to queue up to 500 leads that need emails. Max is 10,000 per start.
Start finding emails	Queues missing-email leads and starts checking websites using safe built-in settings.
Stop	Appears only after Auto Scout starts. It stops after the current small group finishes.
Refresh	Reloads counts and recent results.
Move bad emails to review	Moves suspicious emails away from ready sending so they can be checked again.
Delete invalid emails	Deletes clearly bad/fake emails from leads, such as example emails, broken text, or code-looking emails.
Results table	Shows the outcome of recent checks: Trusted, Review, Blocked, or No email.
Recent website checks	Shows recent jobs so you can see what Scout checked and what it found.

Do the hidden settings matter? Yes. Batch size, speed, and rounds affect how hard Scout works at once. Too high can slow the browser or crash mobile. That is why v10.13 hides them and uses safe defaults automatically: 20 checks per group, speed 4, and 3 rounds.

Example: If you enter 2,000 and click Start, Scout will queue up to 2,000 leads, but it will check them in safe small groups instead of trying to open 2,000 websites at once.

Auto Scout Results

Label	Meaning
Trusted	Scout believes the email is usable. Example: info@freshblooms.ca for freshblooms.ca, or an email seen on the contact page.
Review	The email looks possible, but Scout does not have enough proof. Example: an ISP email or an email from another domain. Check it before sending.
Blocked	Scout thinks the email is fake, broken, a placeholder, or from website code. Example: abc@xyz.com, chimpst@ic.com, maps.gst@ic.com.
No email	Scout checked but did not find a usable email. You can try again later if the website has changed or if you add more info.

Verify Emails Page

Use Verify Emails to clean leads before sending.

Element	What it does
Valid/ready rows	Emails that look usable and can be included in sending.
Invalid rows	Emails that look wrong, fake, repeated, broken, or blocked.
Delete all invalid	Removes bad email values in one action. Use it when you see many fake or broken emails.
Redetect	Sends selected leads back to Auto Scout so Scout can try to find a better email.
Remove email + redetect	Deletes the current bad email first, then asks Scout to search again.

Example: If a lead has `www.cr@edfurniture.com`, it is probably broken website text. Delete it and redetect.

Send Emails Page

Send Emails should feel like a simple checkout. Choose who, choose message, choose sender, then send.

Element	What it does
Ready to send	Number of leads Scout can contact now. A contactable lead has an email, is not blocked, did not bounce, and matches your filters.
Connected senders	Gmail accounts ready to send. If one hits a limit, Scout should pause it and use another available sender.
Due follow-ups	People who got a message 72+ hours ago and did not send a real reply.
Audience/category	Choose which group to contact, like Shopify or Airtable.
Country	Choose a country from uploaded leads. The app shows countries only, not street addresses.
Template category	Filters templates by message type.
Template	Choose the exact message. First-message templates are for first outreach. Follow-up templates are for due follow-ups. Reply templates are for replying to a prospect.
How many	How many messages to send in this run. This is not a dream-low limit. Test small after a new deploy, then send real volume.
Delay between emails	Wait time between sends. Higher delay is slower but safer.
Sender	Choose one Gmail sender or rotate available senders.
Send Now	Starts sending immediately while Scout is open. Live Work should show each message being sent.
Run Due Sends Now	Starts saved sends whose time has arrived, while Scout is open.
Schedule Email	Saves a send for later. With no cron, you must open Scout and run due sends when needed.

Due Follow-ups

Follow-ups are simple. You do not need to schedule follow-ups. Open Due Follow-ups, choose a follow-up template, and send now.

Element	What it does
Due count	Number of people ready for follow-up. They received a first message 72+ hours ago and did not send a real human reply.
Follow-up template to use	Choose the exact follow-up message. Scout should not use first-message templates here.
Send Due Follow-ups Now	Sends follow-ups immediately while Scout is open.
Open lead	Open the business conversation if you want to see what was sent before following up.

Example: If you sent 1,000 first messages on Monday at 9 AM, many no-response leads become due around Thursday after 9 AM.

Replies Page

Replies separates real people from automatic messages. This matters because real replies are the strongest signal for Scouting Level and Challenges.

Element	What it does
Sync replies + bounces	Checks Gmail for new replies, auto replies, bounces, no-inbox messages, and blocked messages.
Real Replies	Human replies. Examples: not interested, send details, we do not need this, criticism, pricing question. A subject starting with Re: can be a clue, but it is not enough by itself.
Auto Replies	Automatic messages. Examples: ticket created, request received, out of office, feedback request, no-reply, confirmation of receipt.
No inbox / blocked	Messages showing the email failed, mailbox does not exist, or the sender was blocked.
Read	Opens the exact message the prospect sent. Use this before replying.
Reply from Scout	Replies using only the same Gmail account that sent the original message to that business. This is strict and not changeable.

Example: A message saying "Thanks for your perspective, but we do not need this type of review" is a real reply even if it does not convert. A message saying "Your request has been received, ticket 123" is auto.

Business Conversation Page

This page shows the full history with one business.

Element	What it does
Sent messages	Shows what Scout sent to the business.
Inbound replies	Shows what the prospect or system sent back.
Read exact message	Opens the full text so you can understand the reply before answering.
Reply box	Lets you answer the prospect. Scout locks the sender to the Gmail account that sent the original message.

Status tags	Show whether the business is ready, contacted, replied, bad inbox, or needs review.
-------------	---

Templates Page

Templates are saved messages. Use the right type in the right place.

Template type	Where it is used
Initial template	First outreach only. Example: first message to a Shopify store.
Follow-up template	Only for Due Follow-ups after 72 hours with no real reply.
Reply template	Only when answering a real prospect reply.
Subject	Email title. Make it clear and human.
Body	The message text. Use short, direct, useful writing.
Attachments	Add a PDF, image, or file to templates when needed. Example: Shopify seller guide PDF. Keep files small for speed and deliverability.
Fields like {name}	Scout replaces fields with lead data when sending.

Example: A Shopify seller guide PDF can be attached to a Shopify template. Keep it under 2-3 MB when possible. Large attachments slow sending and can hurt delivery.

Settings Page

Settings is for setup and maintenance. You should not need it every day.

Element	What it does
Connect Gmail	Adds a Gmail account that Scout can send from.
Daily safe limit	The maximum you allow one Gmail account to send in one day.
Default max/run	The normal amount one Gmail account can send in one run.
Pause sender	Stops one Gmail account from sending. Scout should pause senders automatically if Gmail says the account hit a limit.
Verify sender	Checks if a Gmail sender is still connected.
Signature text	Your email signature text.
Upload logo	Uploads a logo to Scout storage and gives a public logo URL.
Save signature and logo	Saves the signature inside Scout.
Save + sync to Gmail	Saves the signature inside Gmail too. Use this after fixing duplicate logos.
App Health Check	Checks if core parts are ready: Gmail, templates, leads, due follow-ups, Auto Scout, signature, and more.

Live Work

Live Work is the small window showing what Scout is doing right now.

Element	What it means
---------	---------------

Closed bubble	Default state. Click it when you want to see current work.
Sending to...	Scout is sending an email now.
Sent to...	That email was sent.
Waiting...	Scout is waiting between messages.
Checking website...	Auto Scout is checking a website for email.
Email found	Auto Scout found an email.
Stop	Stops the current send or Auto Scout after the current safe step finishes.

Old stopped work should not stay forever in Live Work. Use delete/clear tools for old stopped sends and notifications.

Notifications

Notifications are short app alerts, not the main work area.

Element	What it does
Bell	Opens notifications.
Mark all read	Marks notifications as seen.
Delete one	Deletes one notification.
Delete all	Deletes all notifications. Use this when the bell is noisy.
Phone reminder	Adds a calendar/phone reminder so you remember to open Scout when a saved send is due. It does not secretly send while the app is closed.

Challenges Page

Challenges make outreach fun and give goals. Some are easy, most should stretch you for weeks or months. Huge goals should take a long time.

Element	What it does
Challenge card	Shows a goal, icon, and progress.
Progress bar	Shows how close you are.
Completed mark	Appears when the goal is reached.
Click challenge	Opens a small popup with steps. It can show hints but should not expose every hidden level formula.
Delivered-message challenges	Examples: 5,000, 10,000, 20,000, 35,000, 100,000, 1,000,000, 10,000,000 delivered messages.
Reply challenges	Examples: 10, 20, 30, 50, 100 real replies in a day. Auto replies should not count.
Gmail challenges	Examples: connect 10, 20, 30, 50 Gmail accounts.
Auto Scout challenges	Examples: find 100, 1,000, 10,000, 100,000 trusted emails.

Scouting Level

Scouting Level is a long-term mastery badge. It should not be easy. Scouting 3,000 leads in one day should be around Rookie, not Strategist.

Level ladder	Novice, Rookie, Apprentice, Scout, Pro Scout, Strategist, Operator, Rainmaker, Commander, Master Scout, Grandmaster, Ultimate.
How it grows	Useful work gives points: real replies, replies sent from Scout, trusted emails found, messages delivered, healthy senders, templates, schedules, Auto Scout work, and app activity.
What matters most	Real replies and replying to prospects from Scout should move the level the most.
What matters less	Easy actions like opening the app or importing leads help a little but are capped so they cannot make someone jump too high.
Hints	Users can see hints for progress, not exact hidden requirements.
Ultimate	The final level. It should be very hard and can take years of serious work.

APK / Android App

The Android app is a wrapper that opens your Scout web app from an app icon.

Element	What it means
APK install	Install the release APK from GitHub Actions. If Android blocks a debug APK, use the release APK.
Allow notifications	Android must allow notifications for phone reminders.
App icon	Opens Scout like a normal app.
Phone reminder	Can show a top-of-phone reminder for scheduled work. It reminds you to open Scout; it does not secretly send when Scout is closed.

iOS / iPhone

The iOS source exists, but iPhone install needs Apple signing through Xcode and an Apple Developer account. A signed IPA cannot be created without that setup.

Option	Meaning
Home Screen web app	Add Scout to Home Screen from Safari. This is the fastest iPhone option.
iOS wrapper source	Can be opened in Xcode and signed with an Apple Developer account.
Notifications	iOS notifications require proper permission and supported setup. Calendar reminders are the simplest reliable option.

Common Problems

Problem	What to do
No contactable leads	Check if leads have emails, are not blocked, match the selected country/category, and are not already contacted.

Auto Scout found weird emails	Use Delete invalid emails, then redetect. Scout should block fake/broken/code-looking emails.
Real replies too high	Sync replies and bounces, then run the reply cleanup SQL if provided. Ticket confirmations and auto messages should not count as real.
Sender reached limit	Scout should pause that Gmail and continue with another sender. Review paused senders in Settings.
Logo appears twice	Save signature and logo again after the dedup fix. Then sync to Gmail again if needed.
App feels slow	Use smaller visible lists, keep Auto Scout on safe defaults, do not open huge tables unless needed, and close unused tabs.

Best Daily Routine

Time	Action
Start of day	Open Home and check analysis. If there are many no-email leads, run Auto Scout.
Before sending	Go to Send Emails. Choose country, category, template, sender, count, and delay.
During sending	Keep Scout open. Watch Live Work only when needed.
After sending	Check dashboard numbers and sender health.
Later	Sync Replies. Read exact prospect messages and reply from Scout.
After 72 hours	Open Due Follow-ups, choose the follow-up template, and send due follow-ups now.
